For the specified projects, Repo compares the local branches to the remote branches updated during the last Repo sync. Repo prompts you to select one or more of the branches that haven't been uploaded for review.

Repo Command Reference | Android Open Source Project

The basics behind how it works are as follows: 1. `repo init -u "url"`
2. `repo sync` The `repo init` is important, the url you specify points to a git repository. In that git repository is a `default.xml` file that is used to control the `repo sync`. That xml file is used to tell `repo` where your git repositories are and how to save them on the computer.
