Mobile robots have the capability to move around in their environment and are not fixed to one physical location. Mobile robots can be "autonomous" (AMR - autonomous mobile robot) which means they are capable of navigating an uncontrolled environment without the need for physical or electro-mechanical guidance devices.

Mobile robot - Wikipedia

An autonomous robot, also known as simply an autorobot or autobot, is a robot that performs behaviors or tasks with a high degree of autonomy. Autonomous robotics is usually considered to be a subfield of artificial intelligence, robotics, and information engineering. Early versions were proposed and demonstrated by author/inventor David L. Heiserman. Autonomous robots are particularly desirable in fields such as spaceflight, household maintenance, waste water treatment, and delivering goods and

An autonomous robot is a machine that acts and behaves with a high degree of independence. By definition, robots are at least semi-autonomous meaning that they can react to some events and conditions without need of direction. The term autonomous robot suggests a machine that can accomplish complex objectives without need of external control. The following are illustrative examples.
